

Advanced traffic and bridge management solutions

Products and solutions

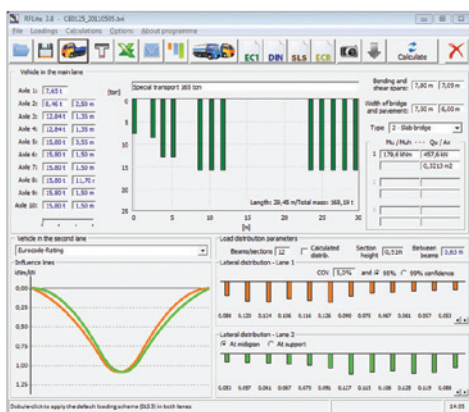

Difference between initial design data and **SiWIM®** data for road layer thickness calculation.

Number of vehicles and traffic loads doesn't have direct relationship

Traffic density graph shows heavy vehicles presence after 22:00

Safety evaluation of the bridge for specific special transport

Maintenance and planning sector, road owners

- WIM data vs. Automatic Traffic Counters data.
- Theoretical parameters and real WIM data.
- Calculation of ESAL and nominal axle load.
- Overloading analysis.
- Overloading histogram.
- Life expectancy of road pavement.
- The applicability of WIM data in the reconstruction and dimensioning of road sections.
- Calculation of road layer thickness.
- WIM data distribution.
- Methodology for penalty calculation for enforcement.
- Road damage calculation.
- Road damage remediation calculation.

Police and other enforcement agencies, environment agencies

- Calculation of the traffic pattern for enforcement.
- Hourly analysis of heavy traffic.
- Traffic flow analysis with ESAL calculation.
- Analysis of outflow of freight vehicles on parallel roads, avoiding traffic control or tolling.
- Dangerous goods transport analysis.

Bridge applications experts and bridge protection

- Bridge site specific traffic load modelling.
- Soft Load Testing of Bridges.
- Realistic Traffic Loading.
- Safety Assessment of Existing Bridges and Maximum Permissible Traffic Loading.
- Safety Evaluation of Bridges for Special Transports.

SiWIM® equipment

Hardware

Based on simple strain gauges, precise amplifiers, fast signal converters and a reliable computer, **SiWIM®** system is a set of basic components, which together form a high-tech, advanced, reliable and scalable system for use in a wide range of different situations, both in the areas of WIM as well as for the analysis of bridge structures.

Software

SiWIM's proprietary software, divided into areas of collecting, adjusting, processing, controlling, analyzing and presenting data, is designed with the user in focus. Sophisticated algorithms are used to significantly ease up all necessary processes, while retaining on demand access to all parameters with extreme expandability.

Collected data

- axle loads,
- gross weight,
- axle distances,
- speed,
- number of axles,
- class/type of vehicle,
- driving lane,
- time and date.

Sensor

Set up of the sensors under slab bridge.

System features

- Mobility
- No road blocks
- Swift installation
- Web access
- High accuracy level
- Stealthy setup
- Modularity
- Damage-free installation

Mobile application

Recycling data

The **SiWIM®** system's unique ability to collect raw and aggregated data offers the users an opportunity to use it for a variety of different fields, such as:

- maintenance,
- planning,
- preselection for enforcement,
- WIM data distribution,
- calculation of the damage to the pavement and/or bridge,
- supervision of dangerous goods transports,
- planning special transports routes,
- bridge assessments.

Bridge protection

Bridge failures can threaten lives and are thus unacceptable. Optimized assessment of existing bridges, particularly if they are old, deteriorated and suffering from reduced carrying capacity, requires as accurate inputs as possible. **SiWIM®** provides two types of essential information to improve bridge safety analyses. Firstly, it collects traffic data and secondly, it identifies the true behaviour of bridges. Even on old and obsolete bridges, all or some of these **SiWIM®** features enhance structural assessment and regularly demonstrate sufficient structural safety without compromising the required safety levels from the codes.
